

List Lake

Water Quality Report – 2017

Overview:

List Lake is located in the northwest portion of Michigan's Lower Peninsula, within the Manistee National Forest. It has a maximum depth of 20 feet and has a surface area of 11 acres. The land surrounding List Lake is dominated by white pine and mixed hardwoods and the soil consists of sandy loam with some areas of peat. Great Lakes Restoration Initiative funding was provided by the US Forest Service to complete this project. All data was collected using the Michigan Clean Water Corps' Cooperative Lakes Monitoring Program which enables citizen volunteers to monitor the health of their lakes. To learn more about the CLMP program or any of the water quality parameters used in this report, visit <https://micorps.net/lake-monitoring/>

We need your help. Collecting consistent data year after year is critical to ensuring the long-term health of List Lake. We need the help of local volunteers to keep this monitoring going. To become a volunteer, contact the Manistee Conservation District 231-889-9666 or Chris Riley (USFS) 231-723-2211 x3122

Parameters:

Secchi Transparency refers to the depth to which a black and white Secchi disk can be seen in the lake water. Water clarity is affected by two primary factors, algae and suspended particulate matter.

Chlorophyll-a is the most dominant chlorophyll pigment in algae and is often used as a direct estimate of algal mass.

Phosphorus is an essential plant nutrient and most often controls aquatic plant growth. It is found in fertilizers, animal waste, and yard waste.

Dissolved Oxygen (DO) is the dissolved gaseous form of oxygen. It is essential for respiration of fish and other organisms. In general, a minimum of 7 mg/L is required to support cold-water fish and 5 mg/L is needed for warm-water fish.

Carlson TSI Score uses summer measurements of secchi transparency, total phosphorus, and chlorophyll-a to assign a trophic state index value to a lake. Values range from 0-100.

Summer 2017 Water Quality Results:

Parameter	# Readings	Min	Max	Average	St. Dev	Carlson TSI
Secchi Disk Transparency (feet)	8	5	7	6.1	0.7	51
Chlorophyll-a (parts per billion)	5	1	9	3.8	3.0	44
Spring Total Phosphorus (parts per billion)	1	11	11	11.0	NA	NA
Summer Total Phosphorus (parts per billion)	1	8	8	8.0	NA	34

Summary:

With an **average TSI score of 43** based on secchi transparency, chlorophyll-a, and summer total phosphorus, this lake is rated as a mesotrophic lake. Mesotrophic lakes are characterized by having medium nutrient content, medium levels of algae, and moderately clear water. Despite its low depth, the bottom waters of List Lake are devoid of oxygen by early summer.

Overall, water quality in List Lake is good but long-term monitoring is necessary for establishing a baseline and investigating trends.

Score the Shore:

Shorelines are the primary habitat for many animals that live on or near a lake. Healthy shorelines are vital for preventing erosion, maintaining water quality, and slowing and filtering rain runoff. Shorelines are threatened by excessive development including construction of lawns, beaches, and sea walls. Using MiCorps' Score the Shore assessment, each 1000' section of the lake was rated based on three categories: littoral (aquatic) zone, riparian zone (land near shore), and shoreline erosion control practices. All three of List Lake's shoreline sections were rated as Good. To learn more about shoreline health, visit <http://www.mishorelinepartnership.org/>

Section	Littoral Zone Score	Riparian Zone Score	Erosion Control Score	Overall Section Score	Section Rating
1	87	91	100	93	Good
2	87	100	100	96	Good
3	87	91	100	93	Good

Aquatic Plant Mapping:

The 2017 List Lake plant survey resulted in 12 native plant species and no non-native species. Aquatic plants are an essential part of the lake and provide many services including holding sediments in place, reducing erosion and maintaining stability. They also provide habitat and food for many organisms. Overall, List Lake supports a healthy community of native plant species and should be protected from new invasions of potentially harmful invasives.

Species	Density	Density Rating
white water lily	2.33	Moderate
watershield	2.13	Moderate
water bulrush	0.80	Found
fern (riparian)	0.33	Found
leather leaf	0.27	Found
sedge	0.27	Found
bog cranberry	0.20	Found
arrowhead	0.13	Found
sphagnum moss	0.13	Found
cattail	0.07	Found
cotton grass	0.07	Found
sundew	0.07	Found

Plant Density Rating

Density	Rating
4 - 5	Dense
3 - 4	Heavy
2 - 3	Moderate
1 - 2	Sparse
0 - 1	Found
